<p>* These ETFs are different from traditional ETFs. Traditional ETFs tell the public what assets they hold each day. These ETFs will not. This may create additional risks for your investment. For example: You may have to pay more money to trade the ETF's shares. These ETFs will provide less information to traders, who tend to charge more for trades when they have less information. The price you pay to buy ETF shares on an exchange may not match the value of the ETF's portfolio. The same is true when you sell shares. These price differences may be greater for these ETFs compared to other ETFs because they provide less information to traders. These additional risks may be even greater in bad or uncertain market conditions. The ETFs will publish on its website each day a "Tracking Basket" designed to help trading in shares of the ETFs. While the Tracking Basket includes some of the ETF's holdings, it is not the ETF's actual portfolio. The differences between these ETFs and other ETFs may also have advantages. By keeping certain information about the ETFs secret, these ETFs may face less risk that other traders can predict or copy its investment strategy. This may improve the ETF's performance. If other traders are able to copy or predict the ETF's investment strategy, however, this may hurt the ETF's performance. For additional information regarding the unique attributes and risks of these ETFs, see section below.</p>		PASSIVE BROAD-BASED EQUITY ETF Fidelity® NASDAQ Composite Index® ETF [†] (ONEQ)

Prior to 1/29/21 Fidelity® NASDAQ Composite Index® ETF was named Fidelity Nasdaq Composite Index® Tracking Stock.

Additional information for Active Equity ETFs: The objective of the actively managed ETF Tracking Basket is to construct a portfolio of stocks and representative index ETFs that tracks the daily performance of an actively managed ETF without exposing current holdings, trading activities, or internal equity research. The Tracking Basket is designed to conceal any nonpublic information about the underlying portfolio and only uses the Fund's latest publicly disclosed holdings, representative ETFs, and the publicly known daily performance in its construction. You can gain access to the Tracking Basket and the Tracking Basket Weight overlap on Fidelity.com or i.Fidelity.com. Although the Tracking Basket is intended to provide investors with enough information to allow for an effective arbitrage mechanism that will keep the market price of the Fund at or close to the underlying NAV per share of the Fund, there is a risk (which may increase during periods of market disruption or volatility) that market prices will vary significantly from the underlying NAV of the Fund; ETFs trading on the basis of a published Tracking Basket may trade at a wider bid/ask spread than ETFs that publish their portfolios on a daily basis, especially during periods of market disruption or volatility, and, therefore, may cost investors more to trade, and although the Fund seeks to benefit from keeping its portfolio information secret, market participants may attempt to use the Tracking Basket to identify a Fund's trading strategy, which, if successful, could result in such market participants engaging in certain predatory trading practices that may have the potential to harm the Fund and its shareholders.

Because shares are traded in the secondary market, a broker may charge a commission to execute a transaction in shares, and an investor may incur the cost of the spread between the price at which a dealer will buy shares and the price at which a dealer will sell shares.

There is no guarantee that a factor-based investing strategy will enhance performance or reduce risk. Before investing, make sure you understand how the fund's factor investment strategy may differ from that of more traditional index products. Depending on market conditions, a fund may underperform, potentially for extended periods of time, compared to products that seek to track a more traditional index. The return of an index ETF is usually different from that of the index it tracks because of fees, expenses, and tracking error. An ETF may trade at a premium or discount to its Net Asset Value (NAV).

Stock markets are volatile and can decline significantly in response to adverse issuer, political, regulatory, market, or economic developments. Because of their narrow focus, sector funds tend to be more volatile than funds that diversify across many sectors and companies. Each sector fund is also subject to the additional risks associated with its particular industry.

In general the bond market is volatile, and fixed income securities carry interest rate risk. (As interest rates rise, bond prices usually fall, and vice versa. This effect is usually more pronounced for longer-term securities.) Fixed income securities also carry inflation, credit, and default risks for both issuers and counterparties. Unlike individual bonds, most bond funds do not have a maturity date, so holding them until maturity to avoid losses caused by price volatility is not possible. Foreign securities are subject to interest rate, currency exchange rate, economic, and political risks. The securities of smaller, less well-known companies can be more volatile than those of larger companies.

Exchange traded funds (ETFs) are subject to market fluctuation and the risks of their underlying investments. ETFs are subject to management fees and other expenses.

Not NCUA or NCUSIF insured. May lose value. No credit union guarantee.
